**Subject: Response Comments for Olympia High School Addition TIA dated 12/26/2018**

**File: 18-4309**

The following is a response to Item 8.c Public Comments

Based on discussion with the district, the practice field use is not expected to change substantially under the new design with traffic impacts not expected to change. The school district has responded in detail as to the intended use of the practice areas.

The following are in response to comments from section 9 Transportation / Frontage Improvements.

1. Two-hour average LOS were performed for the intersections of Henderson Ave & Carlyon Ave and Henderson Ave & North St. Tables 4 & 7 reflect two-hour average calculated delays. Additional LOS sheets have been included in the appendix.
2. LOS total intersection was reported using City of Olympia's weighted average methodology for the intersection of Henderson Ave & Carlyon Ave in addition to the critical approach delay (see Tables 4 & 7). Calculation sheets have been included in the appendix.
3. Statements acknowledging that two-hour average LOS delays would have similar or better results for the school accesses as little school traffic would emanate to/from the site during off-peak times.
4. Henderson Blvd & Carlyon Ave was shown to operate at LOS F (52.8 sec) using the two-hour average delay with no mitigation or LOS C (20.3 sec) with the use of a TWLTL on Henderson Blvd.
5. Left turn warrants were revised using Figure 6: Left Turn Warrant from the Engineering Design and Development Standards (EDDS) Chapter 4. A left turn lane was found to be warranted at the West Parking 2 on Carlyon Ave and not the North Street entrances. The major influence of school related traffic creates a reduced speed lessening safety concerns. In addition, the reopening of the gate will create rebalancing of traffic between North Street and Carlyon Avenue which should redistribute some of the traffic off of Carlyon. Major widening along Carlyon to accommodate this short term, AM timeframe congestion is not proposed.

6. This has been discussed with the district. The previously closed gate on the west side of the camp which didn't allow cross circulation is now proposed to remain open which will create a balancing in traffic to the site.
7. With the provided volumes, a traffic signal is not warranted at the intersection of Henderson Blvd & Carlyon Ave.
8. The site has been revised to remove the street access in question.
9. A signal warrant analysis, based on MUTCD Warrant 3, shows a signal is not warranted at the School Loop entrance on North Street. Applicable warrant sheet is included in the appendix.

# OLYMPIA HIGH SCHOOL

## TRAFFIC IMPACT ANALYSIS

### 1. INTRODUCTION

The main goals of this study focus on the assessment of existing roadway conditions and forecasts of newly generated project traffic. The first task includes the review of general roadway information on the roadways serving the site, baseline conditions, and entering sight distance data. Forecasts of future traffic and dispersion patterns on the street system are then determined using established trip generation and distribution techniques. As a final step, appropriate conclusions and mitigation measures are defined if needed.

### 2. PROJECT DESCRIPTION

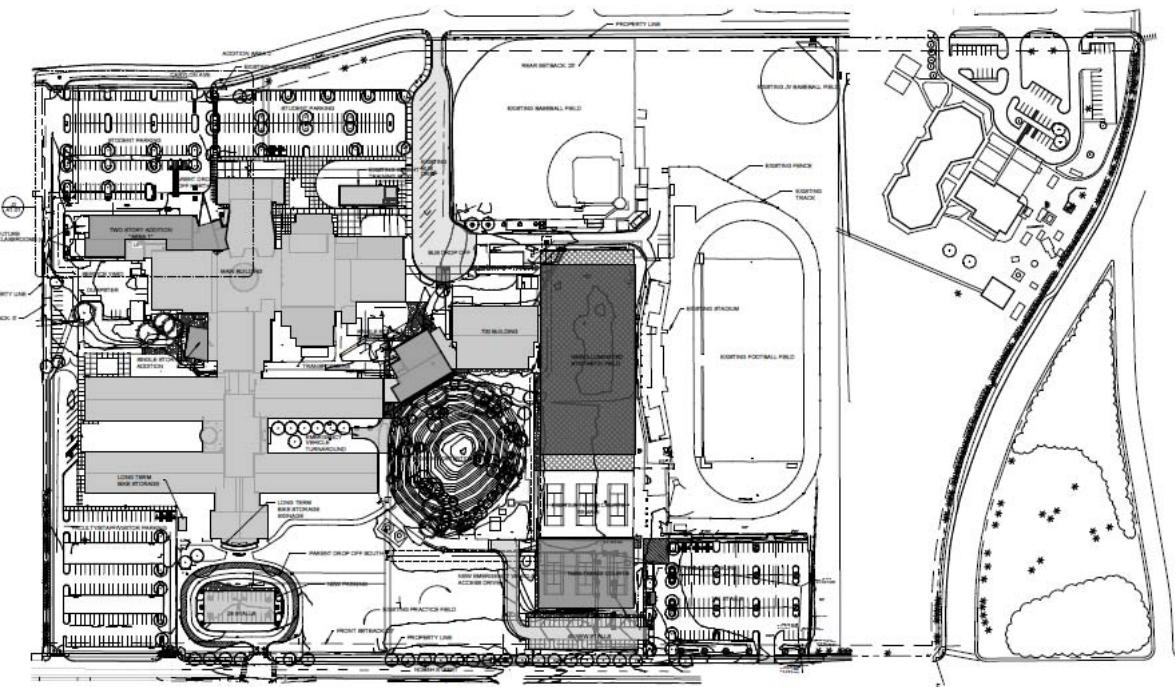

The Olympia School district proposes to modernize and build approximately 41,000 square feet of additions to the existing Olympia High School. The high school was originally opened in 1961 and last had updates in 1999-2000. The proposed additions would include 25 new classrooms in three separate areas, new parking configurations, and new playing fields. The school will remain at its current location bordered by Carlyon Avenue SE to the north, North Street SE to the south, and Henderson Blvd SE to the east. The 52-acre campus is situated on parcel 09890050000 at 1113 Legion Way SE. Existing student capacity/enrollment at the high school is 1850 students. The new school will eliminate portables and increase student capacity to 2105.

A site plan illustrating the overall configuration of the proposed additions is presented in Figure 2. The project has an anticipated completion date of 2021. For conservative purposes, this analysis assumes the school to operate at full-capacity for the 2021 horizon year.

FIGURE 2

### 3. EXISTING CONDITIONS

#### 3.1 Surrounding Roadway System

The street network serving the high school consists of a variety of roadways. The roadways and arterials surrounding the site are listed and described below.

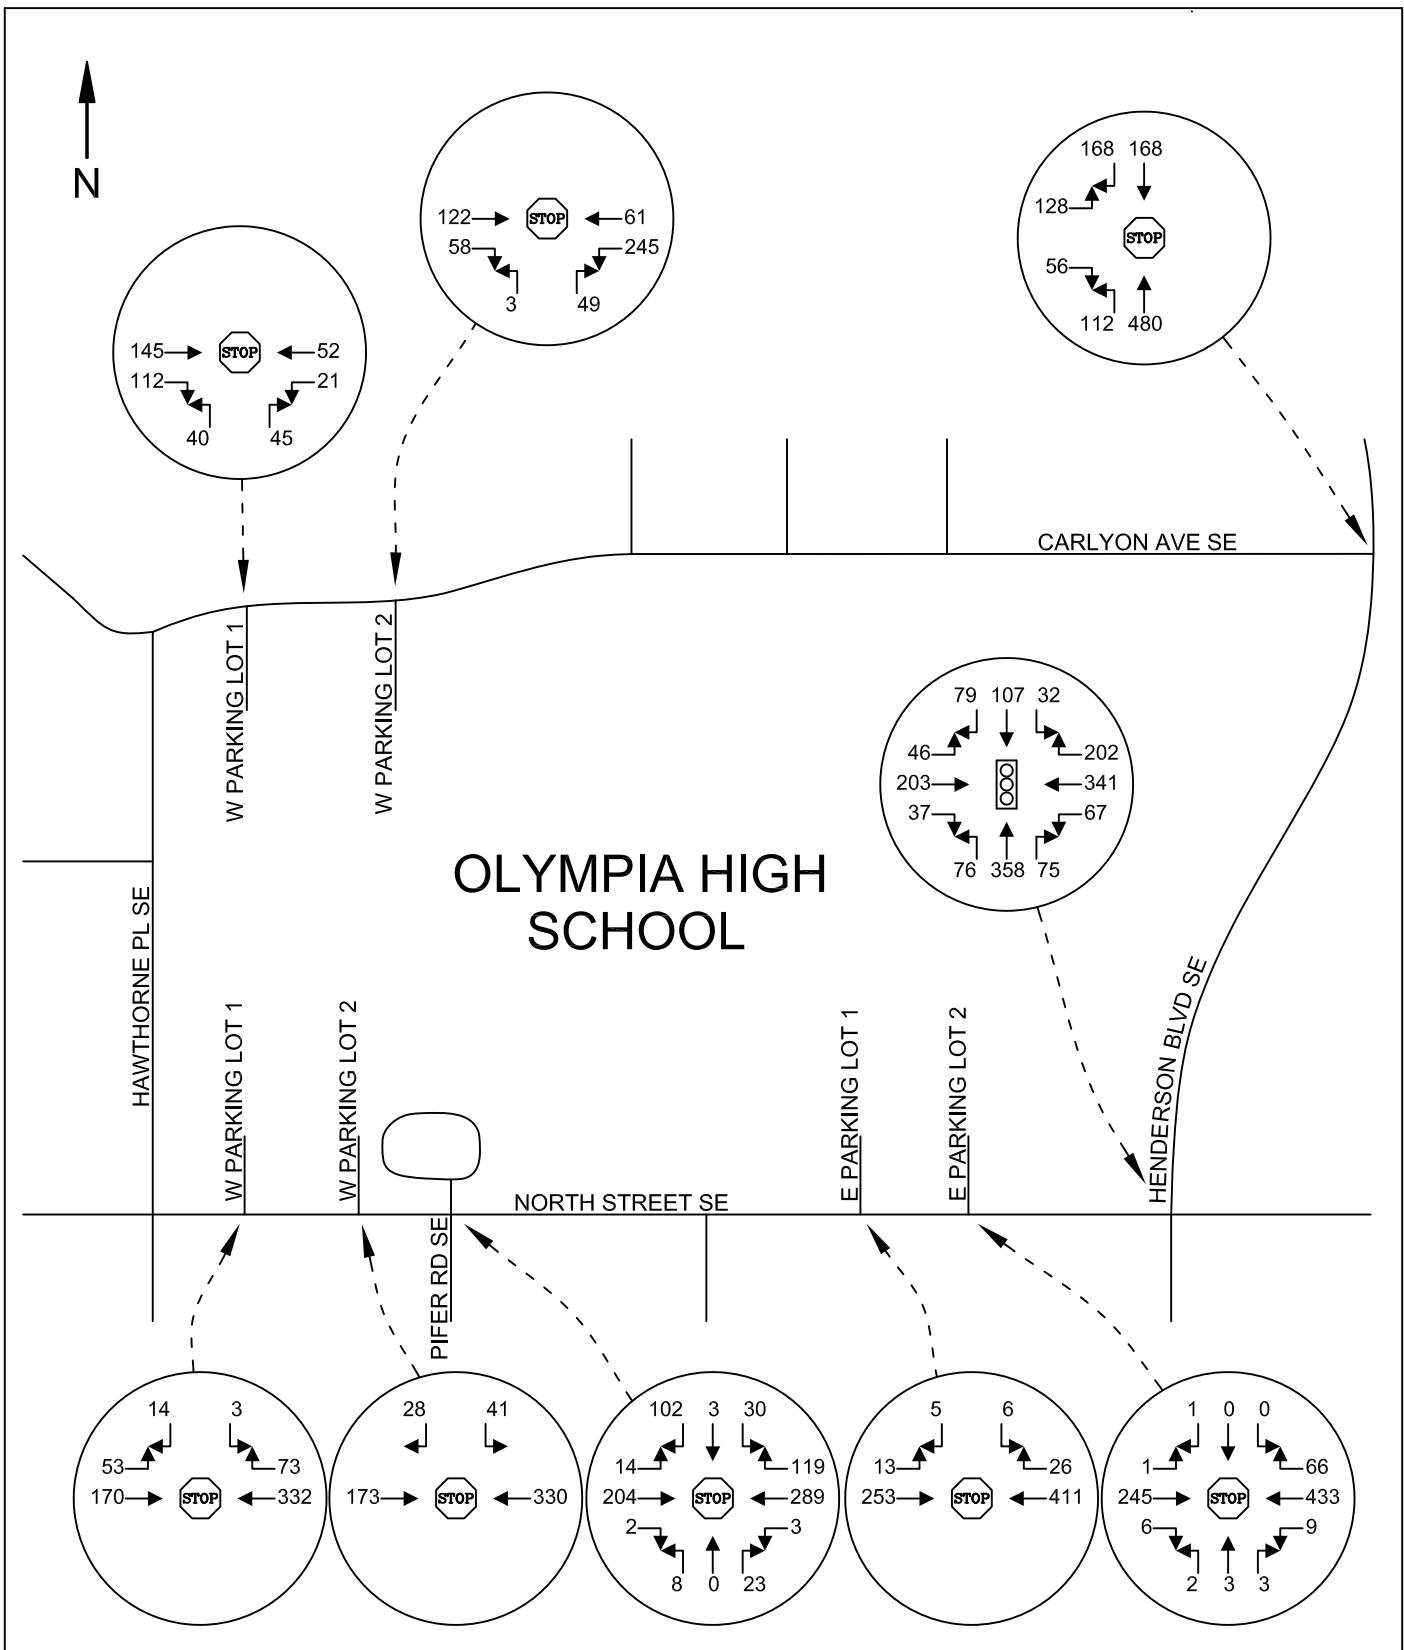

**Table 1**  
Roadway Network

Roadway	Functional Classification	Speed Limit	Travel Lanes	Sidewalk	Bike Facilities
Henderson Blvd	Arterial (Plum St to North St) Major Collector (North St to Yelm Hwy)	20-35 mph	2/3	S/O Eskridge Blvd	Yes
Carlyon Ave	Major Collector	20-25 mph	2	Yes	Yes
North St	Major Collector	20-25 mph	2	Yes	Yes
Hawthorne Pl SE	Local	25 mph	2	Yes	No

#### 3.2 Existing Peak Hour Volumes and Patterns

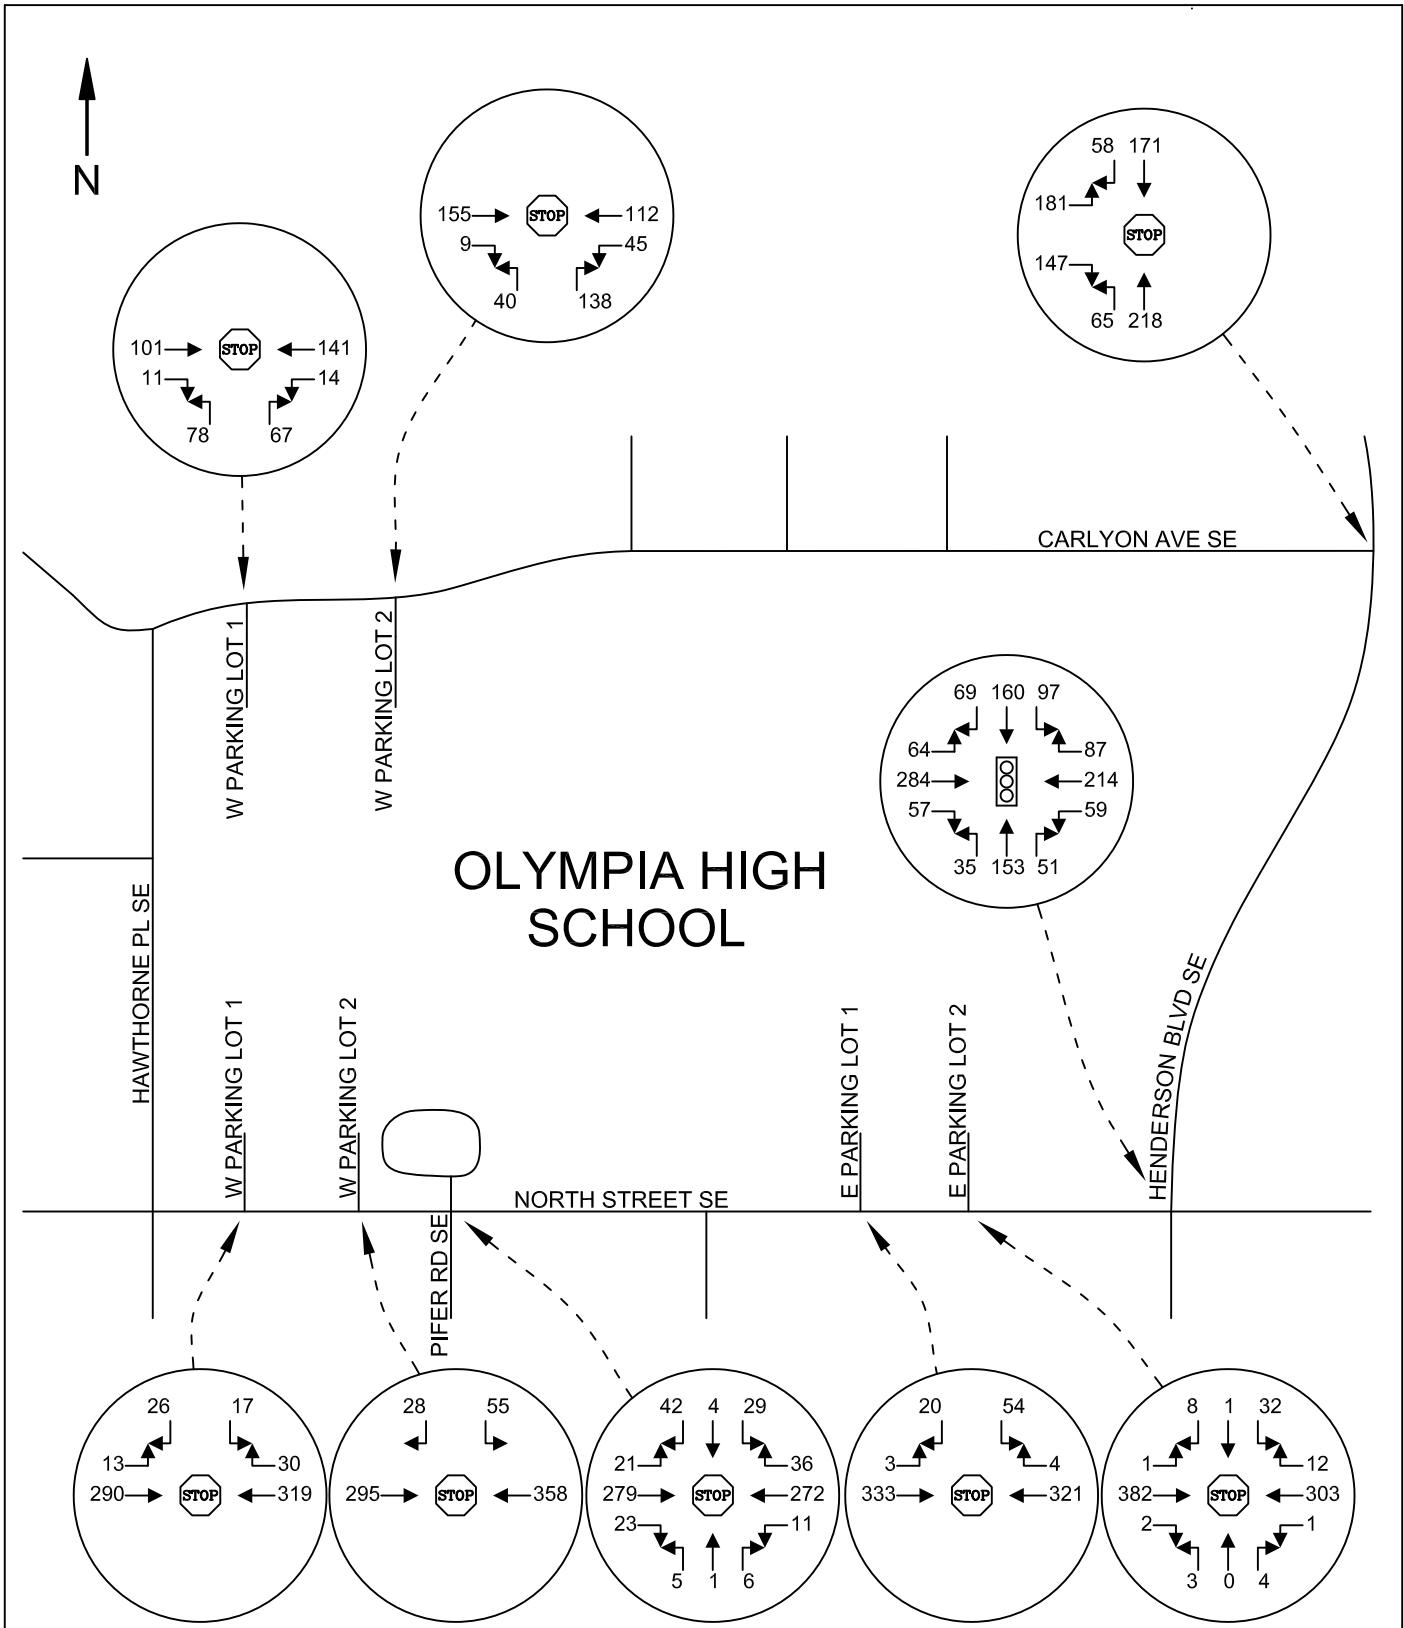

Field data for this study was collected in June of 2018 while school was still in session to capture existing travel patterns associated with the current Olympia High School. Counts were taken to coincide with the school's peak travel demands defined by set bell schedules. Olympia High School's typical bell schedule is from 7:45-2:22 PM with one-hour early release on Wednesdays. Field counts were performed from 6:45-8:45 AM and from 1:45-3:45 PM (non-Wednesday) and were taken at all seven of the school's primary access points. In addition, the City of Olympia has provided turning movement data for the two nearby intersections: Henderson Blvd SE & Carlyon Avenue SE and Henderson Blvd SE & North Street SE. Data for these intersections consisted of the school's peak AM and PM travel times as well as the adjacent streets peak from 4-6PM.

The one hour exhibiting the highest overall vehicular volumes (peak hour) at each access and intersection is then used for capacity and delay analysis. Figure 3-5 illustrates peak hour volumes captured at each respective location for all time period scenarios. Full-count data sheets have been attached to the appendix for reference.

### 3.3 Non-Motorist Traffic & Safety

The surrounding area has a robust network of non-motorist facilities in the form of complete sidewalk networks, marked crosswalks, and bike lanes. Moreover, adequate school zone signage was identified on the adjacent arterials with reduced speed limits when flashing to reduce potential conflicts between motorist and non-motorist traffic. A rapid flashing beacon (RFB) was installed at the intersection of Henderson Blvd SE & Carlyon Avenue SE along with additional crosswalk signage at Henderson Blvd SE & North Street SE to enhance driver awareness. Additional information with respect to pedestrian and cyclist safety is discussed in Accident History.

### 3.4 Accident History

A list of the recorded accident history from 2014 through 2016 for the study intersections and corridors was requested and obtained from the City of Olympia. A summary of the accident totals per year and estimated collisions per million entering vehicles (MEV) at the intersections is provided in Table 2 below.

**Table 2**  
Accident History

Location	2014	2015	2016	Avg/yr	Crash Rate (per MEV)
<b>Henderson Blvd SE</b>					
at: Carlyon Ave SE	4	0	1	1.67	0.44
between: Carlyon Ave SE & North Street SE	1	1	0	0.67	--
at: North Street SE	6	7	4	5.67	0.81
<b>Carlyon Avenue SE</b>					
between: Hawthorne PI SE & Henderson Blvd SE	2	2	1	1.67	--
<b>North Street SE</b>					
between: Hawthorne PI SE & Henderson Blvd SE	2	1	1	1.33	--

A review of the crash data indicates the most common accident occurrences were in the form of turning approach (9), rear-end collisions (8), pedestrian/cyclist (6), right-angle (6), and other (4). No fatalities were recorded. Crash rates were determined at the major intersections for safety analysis. A common threshold when determining the need for potential additional safety analyses are crash rates above 1.0 MEV. As shown, rates fall below this threshold. However, it should be noted that all turning approach collisions occurred at the intersection of Henderson Blvd SE & North Street SE. It should also be

noted that each of the accidents involving a non-motorist took place at or near the intersections of Henderson Blvd SE & Carylon Ave SE and Henderson Blvd SE & North Street. The trend, however, has been declining (2014-3; 2015-2; 2016-1) though more data may be needed. Two pedestrian accidents occurred outside school hours. The City may want to further investigate intersection conditions if trends continue and/or increase.

### 3.5 School Access

North Street SE is a relatively flat roadway with no sight distance impediments. The seven existing entrances as illustrated in Figure 3 will continue serving the high school subsequent to the proposed additions. No sight distance deficiencies are identified.

### 3.6 Existing Level of Service

Existing peak hour delays were determined through the use of the *Highway Capacity Manual* 6th Edition. Capacity analysis is used to determine level of service (LOS) which is an established measure of congestion for transportation facilities. The range<sup>1</sup> for intersection level of service is LOS A to LOS F with the former indicating the best operating conditions with low control delays and the latter indicating the worst conditions with heavy control delays. Detailed descriptions of intersection LOS are given in the 2016 Highway Capacity Manual. Level of service calculations were made through the use of the Synchro 10 analysis program. Table 3 on the following page summarizes existing access delays at Olympia High School; Table 4 summarizes existing intersection delays.

---

<sup>1</sup> *Signalized Intersections - Level of Service*

<u>Level of Service</u>	Control Delay per <u>Vehicle (sec)</u>
A	$\leq 10$
B	$> 10 \text{ and } \leq 20$
C	$> 20 \text{ and } \leq 35$
D	$> 35 \text{ and } \leq 55$
E	$> 55 \text{ and } \leq 80$
F	$> 80$

*Stop Controlled Intersections – Level of Service*

<u>Level of Service</u>	Control Delay per <u>Vehicle (sec)</u>
A	$\leq 10$
B	$> 10 \text{ and } \leq 15$
C	$> 15 \text{ and } \leq 25$
D	$> 25 \text{ and } \leq 35$
E	$> 35 \text{ and } \leq 50$
F	$> 50$

**Table 3**  
**Existing Level of Service – School Accesses**  
*Delays given in seconds per vehicle*

Access	Control	LOS	School AM Peak Hour	School PM Peak Hour
			Delay	Delay
<b>North Street SE</b>				
West Parking 1	Stop	B	14.4	B
West Parking 2	Stop	C	17.1	B
Loop & Pifer Rd SE	Stop	D	32.9	B
East Parking 1	Stop	C	18.4	C
East Parking 2	Stop	C	22.2	C
<b>Carlyon Ave SE</b>				
West Parking 1	Stop	C	16.0	B
West Parking 2	Stop	B	13.3	B

Existing delays at the school's entrances are shown to operate at LOS C or better with the exception of the student loop at North Street SE which is shown to operate at LOS D for the AM peak hour. This access was shown to support a significant amount of school-related traffic in a relatively short time period. No delay deficiencies at this access are observed outside of the school AM peak hour. All two-hour average delays would be significantly lower as school driveways support little vehicular activity outside school peak times.

**Table 4**  
**Existing Level of Service – Adjacent Street Intersections**  
*Delays given in seconds per vehicle*

Intersection	Control	Approach	School AM	School PM	Adjacent Street
			Peak Period	Peak Period	PM Peak Period
Henderson Blvd SE & Carlyon Ave SE	Stop	Overall	A	7.0	A
		EB	E	36.6	C
Henderson Blvd SE & North Street SE	Signal	Overall	B	18.0	A
				9.3	B
					15.4

Two-hour average delays were calculated for the adjacent intersections summarized in Table 4. Existing delays are shown to operate at LOS E at the intersection of Henderson Blvd SE & Carlyon Avenue SE for the existing AM peak period. The influx of school-related traffic causes said intersection to operate with substandard LOS for a short duration while parents and students arrive and depart. Other peak hour time periods are shown to operate with acceptable LOS C.

## 4. FUTURE TRAFFIC DEMAND

### 4.1 School Traffic Generation

The current student capacity/enrollment of Olympia High School is approximately 1,850 students with the updated campus supporting not more than 2,105 students. To determine new trips associated with the potential increase in students, data from the Institute of Transportation Engineers (ITE) publication *Trip Generation* was used for trip rate derivations. Consistent with the City's current Transportation Impact Fee Rate, ITE's 9th Edition manual rates were applied. The independent variable "students" was used for trip generation determination and consisted of the high school at full-capacity, or 255 new students. Table 5 below summarizes anticipated trips for the average weekday daily trips (AWDT), the school's AM and PM peak hours and the adjacent street (4-6 PM) peak hour timeframes. Refer to the appendix for trip generation output.

**Table 5**  
Project Trip Generation

Land Use (530)	Net Increase	AWDT	School Peak Hour						Adjacent St PM Peak Hour		
			AM			PM			In	Out	Total
			In	Out	Total	In	Out	Total			
High School	255 students	436	75	35	110	24	50	74	16	17	33

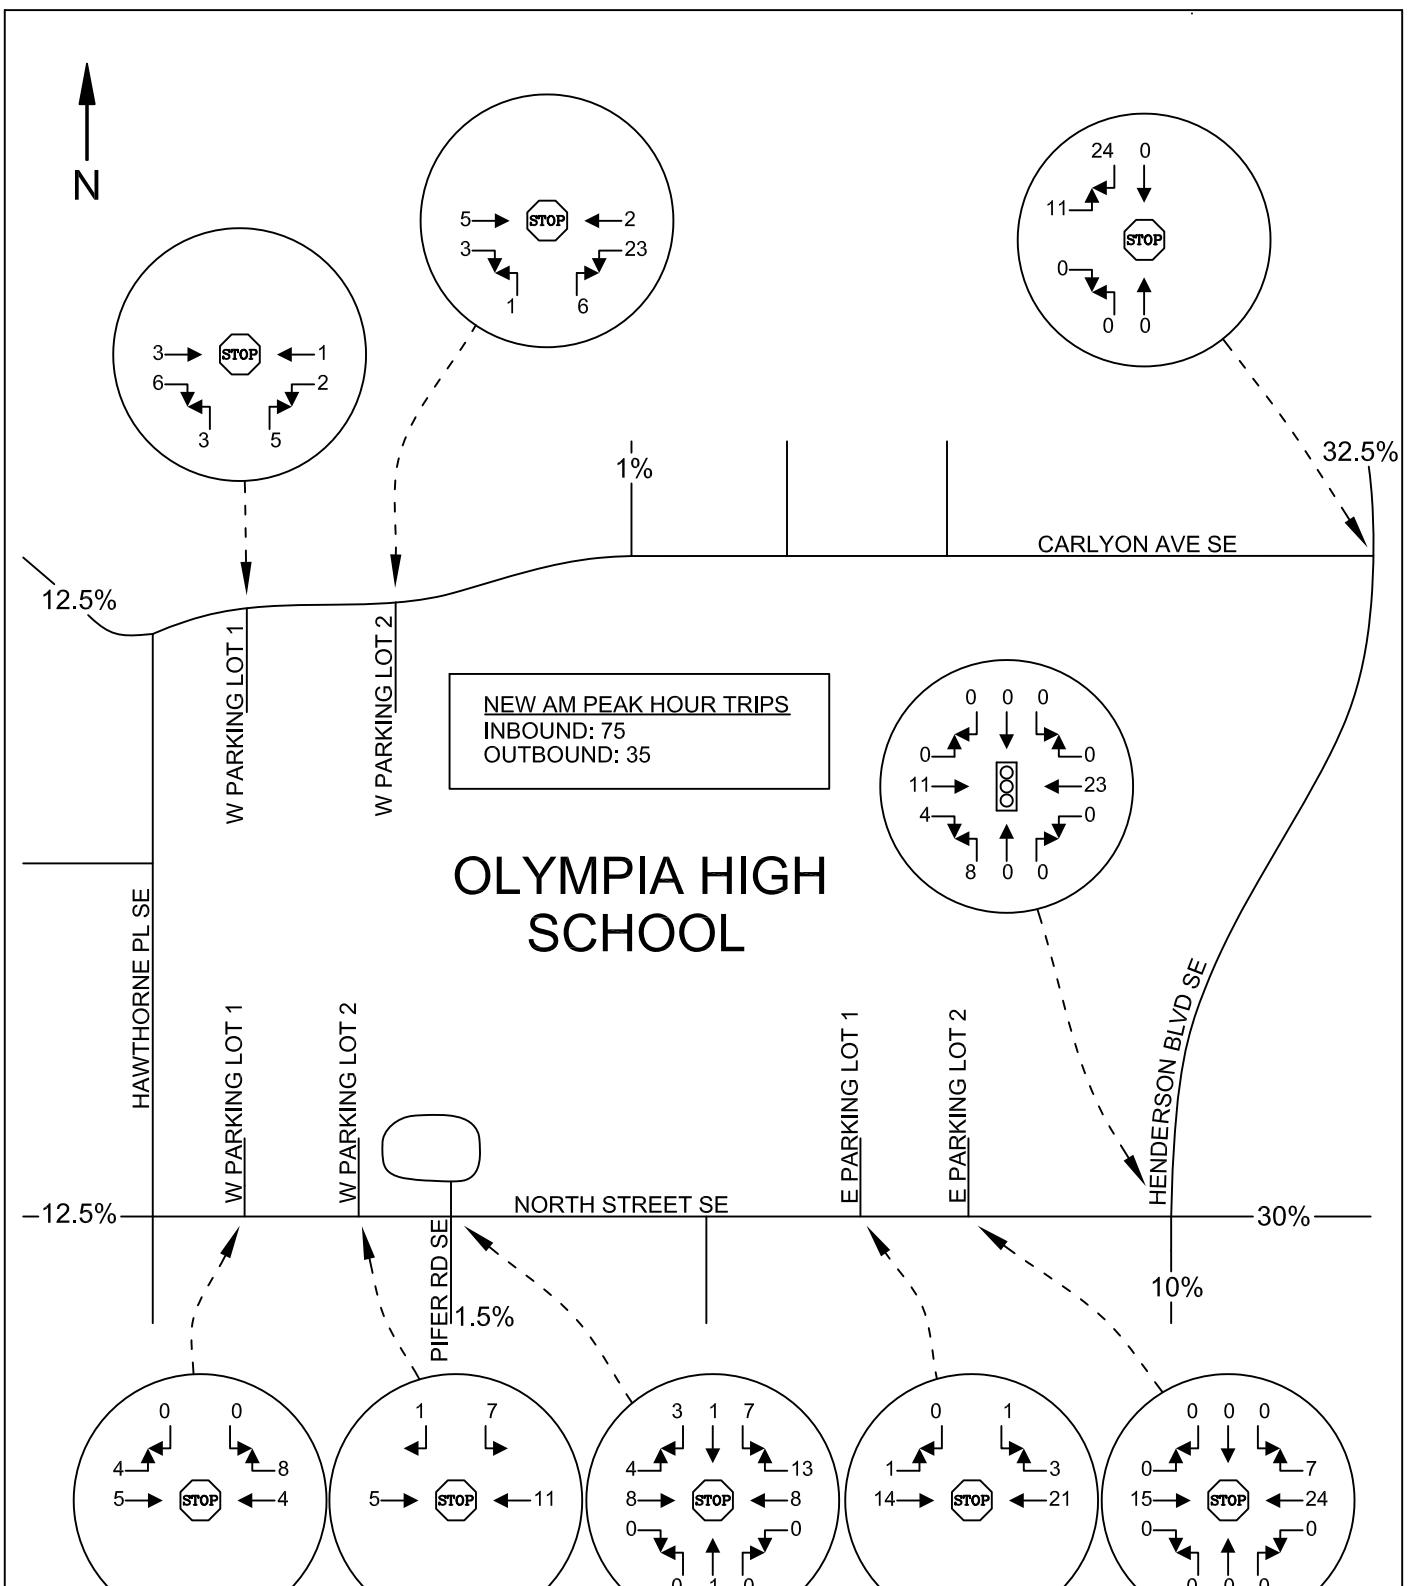

Table 3 above indicates an increase of 110 AM and 74 PM school peak hour trips would be estimated with Olympia High School at full student capacity.

### 4.2 Distribution & Assignment

Trip distribution percentages were obtained from Thurston County Regional Planning Council and were derived from the TAZ-323 distribution map. Percentages and new trip routes are illustrated on the following figures (Figures 6-8) for each time period scenario. New trips taken to/from Olympia High School's accesses are based on existing patterns identified from field data and coordinated with the new site plan.

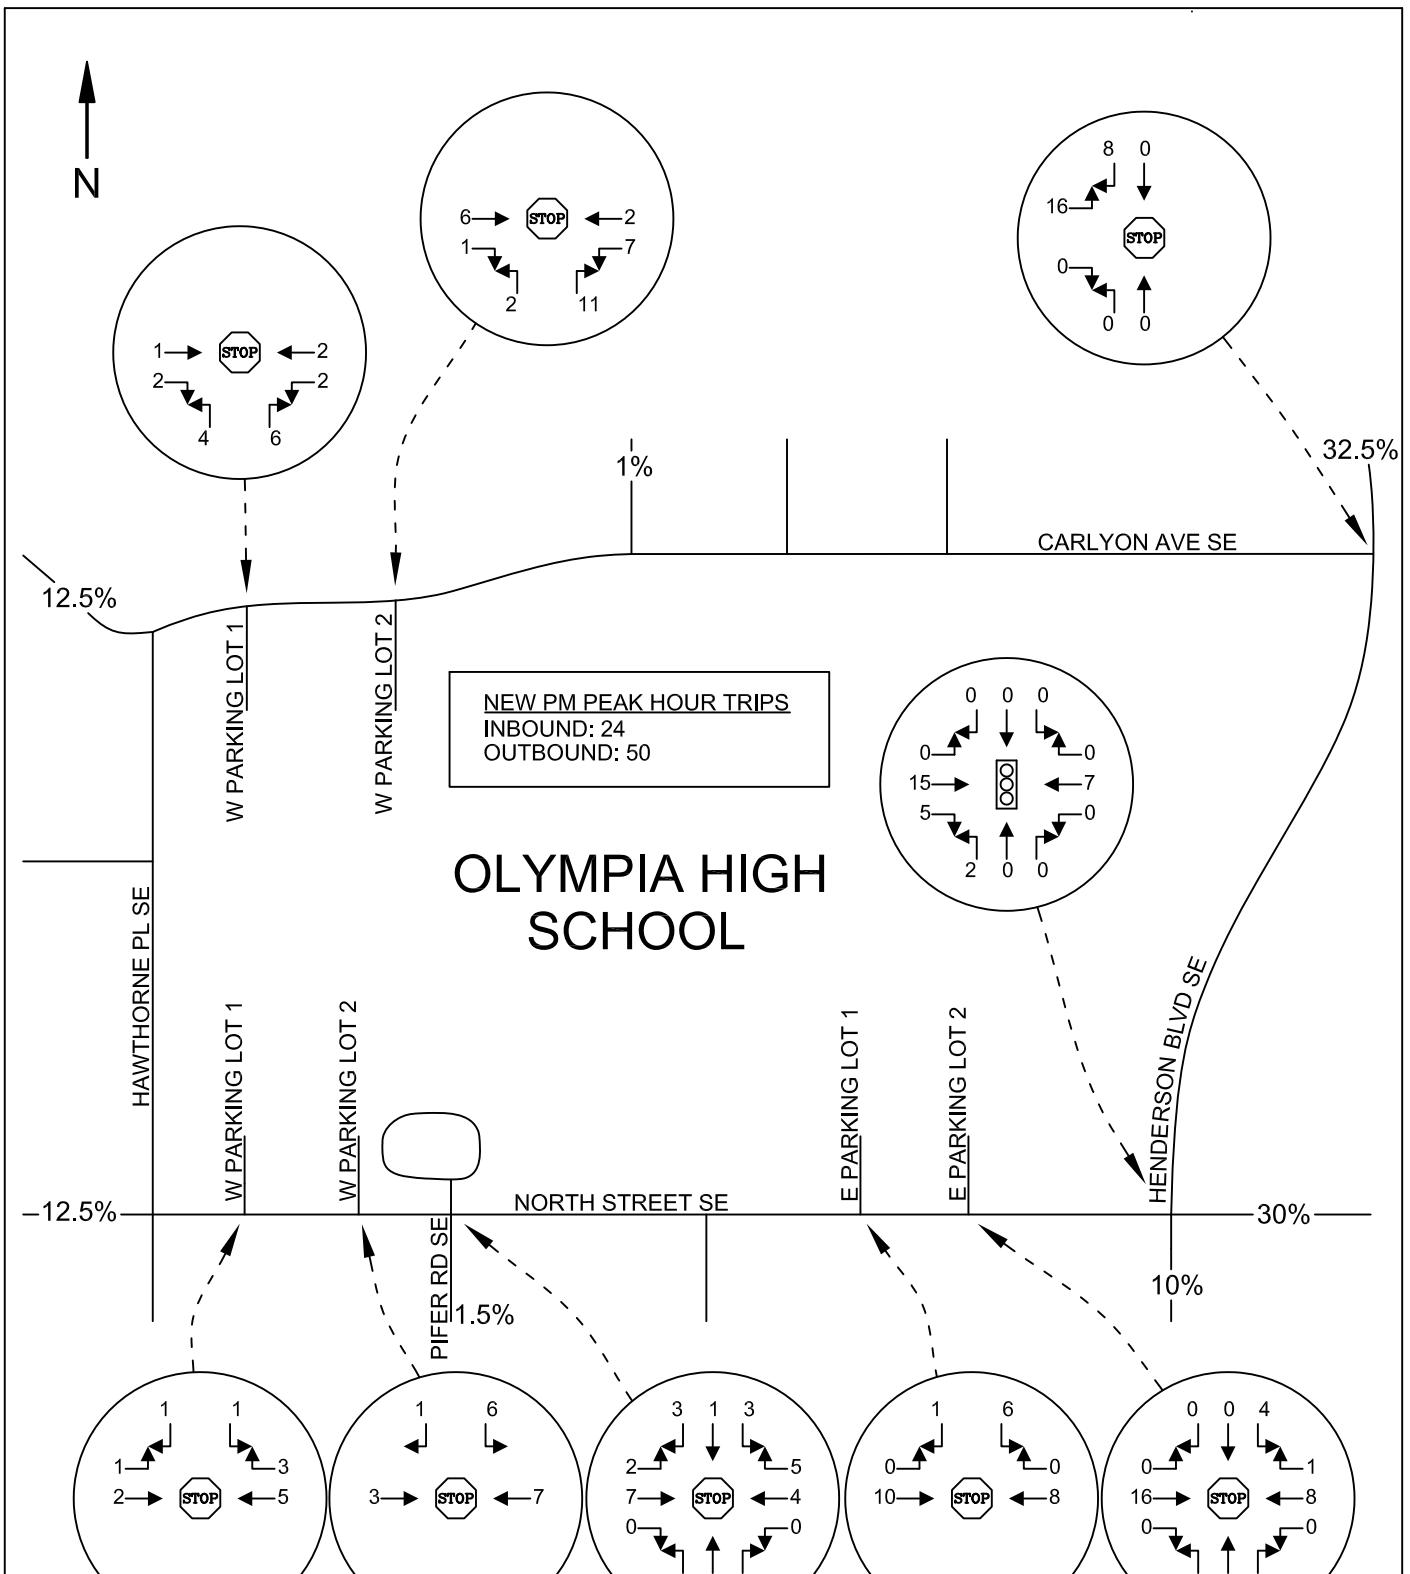

### 4.3 Forecast Traffic Volumes

A 3-year horizon of 2021 was used to assess forecast conditions at the time of anticipated project buildout. Growth was accounted by assuming the school to operate at full student capacity of 2,105 for the school peak hours. Furthermore, a 2 percent ambient annual growth rate was applied to all intersection movements not receiving school-related traffic. Similarly, the 2 percent ambient growth rate was applied to all movements for the 4-6 PM scenario. Forecast 2021 peak hour volumes are illustrated in Figures 9-11.

FIGURE 11

#### 4.4 Future Level of Service

Level of service analyses were made of the future school AM and PM peak hour volumes at the key roadways and intersections using the *Synchro 10* analysis program. Delays for the school accesses and adjacent intersections under future conditions are shown below in Table 6 and Table 7, respectively.

**Table 6**

2021 Level of Service with Project – School Accesses

*Delays given in seconds per vehicle*

*School AM Peak Hour      School PM Peak Hour*

Access	Control	LOS	Delay	LOS	Delay
<b>North Street SE</b>					
West Parking 1	Stop	B	14.7	B	13.3
West Parking 2	Stop	C	18.4	B	14.3
Loop & Pifer Rd SE	Stop	E	45.6	B	14.4
East Parking 1	Stop	C	20.1	C	15.7
East Parking 2	Stop	C	24.3	C	17.2
<b>Carlyon Ave SE</b>					
West Parking 1	Stop	C	17.2	B	11.7
West Parking 2	Stop	C	15.5	B	13.0

The student loop at North Street SE is shown to operate at LOS E for the AM peak hour. As previously mentioned, this entrance supports a significant amount of vehicular activity for a short duration. Minimal delays are observed outside the school's AM peak hour. All other entrances are shown to operate with acceptable LOS. Again, all two-hour average delays would be significantly lower as school driveways support little vehicular activity outside school peak times.

**Table 7**

2021 Level of Service with Project – Adjacent Street Intersections

*Delays given in seconds per vehicle*

*School AM      School PM      Adjacent Street  
Peak Period      Peak Period      PM Peak Period*

Intersection	Control	Approach	LOS	Delay	LOS	Delay	LOS	Delay
Henderson Blvd SE & Carlyon Ave SE	Stop	Overall	A	9.6	A	6.1	A	3.1
		EB	F	52.8	C	18.4	C	19.5
		With TWL TL	EB	20.3	B	14.6	B	14.8
Henderson Blvd SE & North Street SE	Signal	Overall	C	20.6	A	10.0	B	17.8

As summarized in Table 7, forecast 2021 AM two-hour average delays at the intersection of Henderson Blvd SE & Carlyon Avenue SE are shown to operate at LOS F. These delays reflect the school with an additional 255 students and ambient growth. The influx of school-related traffic paired with high northbound volumes on Henderson Blvd SE heading to I-5 result in momentary substandard LOS. The intersection is shown to operate satisfactorily under remaining scenarios. A potential mitigating action of striping to accommodate a two-way left turn lane (TWLTL) on the north leg of Henderson Blvd SE would allow outbound Carlyon Avenue SE traffic to enter the roadway using a two-step maneuver. Delays reflecting the use of TWLTL may be reduced by up over half (52.8 seconds to 20.3 seconds for the AM period).

#### 4.4 Left Turn Warrants

Left turn warrants were analyzed at the school's existing entrances along Carlyon Avenue SE and North Street SE under 2021 peak hour conditions. Left turn warrant calculations were based on Chapter 4 of the City of Olympia's Engineering Design and Development Standards using *Figure 6: Left Turn Warrant*. Two critical accesses receiving the majority of left turns were analyzed: West Parking 2 & Carlyon Avenue SE and West Parking 1 & North Street SE. Based on 2021 school AM peak hour conditions, a left turn lane was found to be warranted at only the Carlyon Entrance. However, the low travel speeds (20 mph for school zones) generally reduces the need to safely remove turning vehicles from the through lane.

In addition, the school is proposing to open the previously closed gate on the west side of the campus to allow for more internal circulation. The opened gate may also relieve left turn traffic at the West Parking 2 entrance by redistributing and balancing routes with other accesses. PM peak and off-peak hours do not require the need for left turn storage on Carlyon Avenue SE. Due to geometrical roadway constraints with low travel speeds and the need for only a short duration of a 24-hour period, left turn channelization may not be required.

#### 4.5 Signal Warrants

A signal warrant was analyzed at the School's Loop entrance opposite Pifer Rd SE on North Street SE. Warrant criteria used the *Manual on Uniform Traffic Control Devices* (MUTCD) Warrant 3 (Peak Hour). Results show that a signal is not warranted based on 2021 AM peak hour volumes with the increased student count. A warrant calculation sheet has been included in the appendix for reference.

In addition, the City of Olympia has performed a signal analysis at the intersection of Henderson Blvd SE & Carlyon Ave SE and found a signal was *not* warranted.

#### 4.6 Practice Field Use

Based on discussions with the Olympia School District, the following narrative regarding practice field use is provided. Overall, traffic will be similar to what is now occurring.

The district is proposing to install a new full size (76,000sf) synthetic turf practice field, to replace the existing grass practice field on the Olympia High School campus, between the 700 (Allied Arts) Building, and Ingersoll Stadium. The Practice Field will not be scheduled for non-district use when Ingersoll is scheduled for event use. The Practice Field can be used for warm ups for the Ingersoll event, or where there is a short overlap (less than one half hour) as a district use or non-district use is ending its use and the Ingersoll event is beginning.)

With this practice field being centrally located on this campus, it helps mitigate light from spilling onto neighboring properties. The light fixtures being proposed for the project are designed to direct light onto the field area, and minimize glare to adjacent properties to the greatest extent possible. Fully shielded LED luminaires focus light only on the field to provide an average of 30 foot-candles of coverage. This is the minimum level of lighting needed for recreational use. The lighting will allow extended use into times with low street traffic volumes but no change in intensity.

There are no bleachers, or public address systems with this proposal. We do not expect large crowds, and anticipate minimal traffic impact as a result of this field being used by the school, or public. Noise makers (Air horns, cowbells, sirens and similar noisemakers) will be prohibited.

Hours of operation for the use of field lights will comply with Olympia School District's Ingersoll Stadium Policy No. 4260P(C) as shown below. Lighting would occur during sporting practices, games, and events as needed. The following hours are proposed.

##### **District Use:**

Monday – Friday 8:00 am – 10:00 pm

Saturday 9:00 am – 10:00 pm

Sunday N/A

##### **Non-District Use:**

Monday – Friday 5:00 pm – 9:00 pm

Saturday 9:00 am – 9:00 pm

Sunday 12:00 pm – 6:00 pm

## **5. CONCLUSIONS AND MITIGATION**

The Olympia School District proposes for approximately 41,000 square feet of additions to Olympia High School located at 1113 Legion Way SE. The project would eliminate on-site portables and increase the campus student capacity from 1850 students to 2105. All seven existing accesses to the school will continue to support ingress/egress. A site plan illustrating the proposed areas for addition and parking configurations is presented in Figure 2. A total of 609 parking stalls would be provided and meet the City's parking requirements. Existing level of service (LOS) at the school access points are summarized in Table 3 and operate at LOS D or better for the school AM and LOS C or better for the school PM peak hours. The intersections of Carylon Avenue SE & Henderson Blvd SE and North Street SE & Henderson Blvd SE were analyzed in terms of two-hour average LOS and are summarized in Table 4. Carylon Avenue SE is shown to operate at LOS E (36.6 sec) for the AM peak hour.

A three-year horizon of 2021 was used in order to assess future impacts to the surrounding roadway network. To perform worst case conditions, the school was assumed to be operating at full-capacity, or a net increase of 255 students. ITE data suggests this would result in an additional 110 AM and 74 PM trips for the school's peak hour travel times and 33 PM peak hour trips for the 4-6 PM adjacent street peak time period. The 2021 AM peak hour level of service analysis shows the student loop driveway on North Street SE operating at LOS E though the two-hour average would be significantly lower once school traffic subsides. Moreover, the intersection of Carylon Avenue SE & Henderson Blvd SE is shown to operate at LOS F (52.8 sec) or LOS C (20.3 sec) if a two-way left turn lane were implemented on the north leg of Henderson Blvd SE. Delays are shown to remain mild at LOS C or better for all locations under forecast 2021 PM peak hour conditions.

A Left turn lane is warranted under forecast 2021 AM peak hour conditions at the West Parking 2 entrance on Carylon Avenue SE. Turn lanes are not warranted at any other access under all time periods. The urban setting and low travel speeds paired with a momentary influx of turning movements may not result in the requirement of a left turn lane. The brief demand of high left turn percentages would require significant storage length to avoid spillover to the adjacent lane and are thus not feasible in this application. Capacity and delays are sufficient throughout the remainder of the day. In addition, the school has proposed to open the gate connecting the north and south parking areas on the west side of the campus. This would allow for opportunities to rebalance and redistribute traffic to other on-site entrances.

Based on the above, recommended mitigation is as follows:

1. Restripe the north leg of Henderson Blvd SE at Carylon Avenue SE to provide a two-way let turn lane (TWLTL). This mitigating action reduces delays and allows outbound traffic to perform a two-step maneuver onto Henderson Blvd SE. Forecast 2021 AM peak hour delays with TWLTL (LOS C 20.3 sec) improves existing conditions (LOS E 36.6 sec) using two-hour average LOS.
2. Pay Traffic Impact Fees as required by the City of Olympia. The City recognizes a 20 percent pass-by reduction on new trips for the high school use. Exact fees and calculations will be determined by the City.

No other mitigation is identified at this time.

**OLYMPIA HIGH SCHOOL  
TRAFFIC IMPACT ANALYSIS**

**APPENDIX**

## LEVEL OF SERVICE

The following are excerpts from the *2016 Highway Capacity Manual - Transportation Research Board Special Report 209*.

Quality of service requires quantitative measures to characterize operational conditions within a traffic stream. Level of service (LOS) is a quality measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience.

Six LOS are defined for each type of facility that has analysis procedures available. Letters designate each level, from A to F, with LOS A representing the best operating conditions and LOS F the worst. Each level of service represents a range of operating conditions and the driver's perception of those conditions.

### Level-of-Service definitions

The following definitions generally define the various levels of service for arterials.

*Level of service A* represents primarily free-flow operations at average travel speeds, usually about 90 percent of the free-flow speed for the arterial classification. Vehicles are seldom impeded in their ability to maneuver in the traffic stream. Delay at signalized intersections is minimal.

*Level of service B* represents reasonably unimpeded operations at average travel speeds, usually about 70 percent of the free-flow speed for the arterial classification. The ability to maneuver in the traffic stream is only slightly restricted and delays are not bothersome.

*Level of service C* represents stable operations; however, ability to maneuver and change lanes in midblock locations may be more restricted than in LOS B, and longer queues, adverse signal coordination, or both may contribute to lower average travel speeds of about 50 percent of the average free-flow speed for the arterial classification.

*Level of service D* borders on a range in which small increases in flow may cause substantial increases in approach delay and hence decreases in arterial speed. LOS D may be due to adverse signal progression, inappropriate signal timing, high volumes, or some combination of these. Average travel speeds are about 40 percent of free-flow speed.

*Level of service E* is characterized by significant delays and average travel speeds of one-third the free-flow speed or less. Such operations are caused by some combination of

adverse progression, high signal density, high volumes, extensive delays at critical intersections, and inappropriate signal timing.

*Level of service F* characterizes arterial flow at extremely low speeds, from less than one-third to one-quarter of the free-flow speed. Intersection congestion is likely at critical signalized locations, with long delays and extensive queuing.

These definitions are general and conceptual in nature, and they apply primarily to uninterrupted flow. Levels of service for interrupted flow facilities vary widely in terms of both the user's perception of service quality and the operational variables used to describe them.

For each type of facility, levels of service are defined based on one or more operational parameters that best describe operating quality for the subject facility type. While the concept of level of service attempts to address a wide range of operating conditions, limitations on data collection and availability make it impractical to treat the full range of operational parameters for every type of facility. The parameters selected to define levels of service for each facility type are called "measures of effectiveness" or "MOE's", and represent available measures that best describe the quality of operation on the subject facility type.

Each level of service represents a range of conditions, as defined by a range in the parameters given. Thus, a level of service is not a discrete condition, but rather a range of conditions for which boundaries are established.

The following tables describe levels of service for signalized and unsignalized intersections. Level of service for signalized intersections is defined in terms of average control delay. Delay is a measure of driver discomfort, frustration, fuel consumption and lost travel time, as well as time from movements at slower speeds and stops on intersection approaches as vehicles move up in queue position or slow down upstream of an intersection. Level of service for unsignalized intersections is determined by the computed or measured control delay and is determined for each minor movement.

Note:

**FOR TOTAL INTERSECTION DELAY**

Major Approach: Left-Through-Right Shared is added together and entered as the left movement with the LT delay.  
 In Olympia drivers do not pass a queued left-turn and are assigned delay.  
 HCS assumes there is no delay for the TH movement. (See HCS2000 manual equation 17-40 and 17-41 text)  
 If there is an exclusive Left-turn lane enter the Through and the Right volume without delay  
 Delay max 1000 sec.

**OLYMPIA HIGH SCHOOL  
TRAFFIC IMPACT ANALYSIS**

**APPENDIX**

**WARRANTS**

## SIGNAL WARRANT ANALYSIS, WARRANT 3

### North Street SE & Looped Entrance/Pifer Rd SE 2021 AM Peak Hour Volumes with Project

Warrant met if criteria in either of the following two categories A and B are met:

- A. If ALL 3 of the following conditions exist for the same 1 hour of an average day: **NOT MET**

1. The total stopped time delay for the minor-street approach equals or exceeds 4 vehicle-hours for a one-lane approach (5 veh-hrs for a two-lane approach).

$$\text{SB: } [(105 + 4 + 37) * 45.6] / 3600 = 1.86 < 4.0 \quad \text{NOT MET}$$

2. The volume on the same minor street approach equals or exceeds 100 vehicles per hour for one moving lane of traffic (150 veh/hr for two moving lanes).

$$\text{SB: } 105 + 4 + 37 = 146 < 100 \quad \text{MET}$$

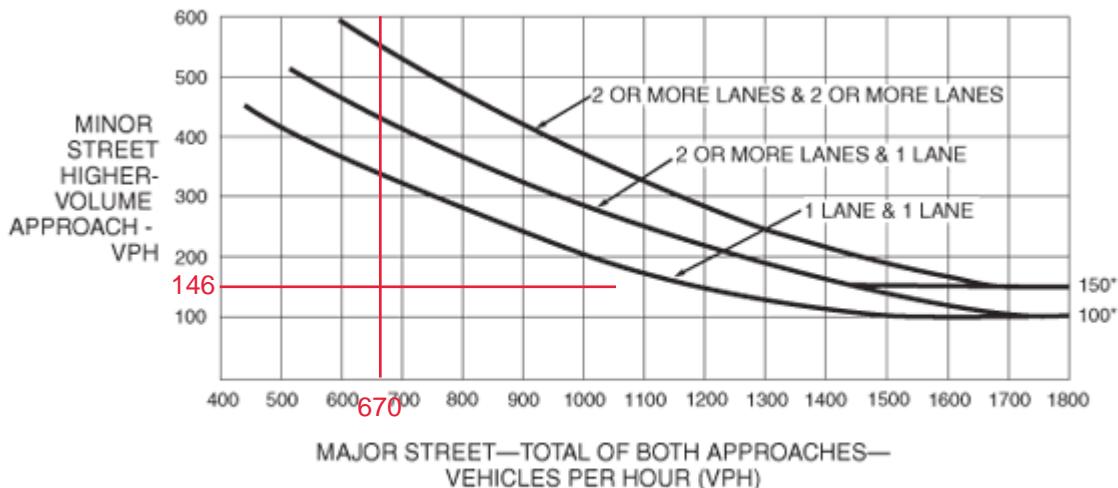

3. The total entering volume serviced during the hour equals or exceeds 650 vehicles per hour for intersections with 3 approaches (800 veh/hr for 4 approaches).

$$848 < 800 \quad \text{MET}$$

- B. The plotted point in Figure 4C-3 falls above the applicable curve for the existing combination of approach lanes. **NOT MET**

**WARRANT 3 NOT MET**  
(Based on estimated future volumes)

**Figure 4C-3. Warrant 3, Peak Hour**

\*Note: 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 100 vph applies as the lower threshold volume for a minor-street approach with one lane.
